

# COMP2155

1

**BUILDING WEB APPLICATIONS**  
**DR. CURTIS GITTENS**

**LECTURE 7**

# Cascading Style Sheets

2

**CRASH COURSE ON CSS**

# Getting to Know You

3

- What are the basic elements used in CSS?

**selector**

**h1 {**  
**}**

**property**

**value**

**background-color: #ccffcc;**

**rule**

**declaration block**

# What Happens When...?

4

- a. A rule is defined incorrectly
- b. Multiple rules are defined for one element
- c. Multiple style sheets are linked in one page

## Answers

- a. The rule is ignored
- b. The rules are applied in the order they occur
- c. The rules in each style sheet are combined and applied, but with exceptions

# Bringing CSS and XHTML Together

5

```
<html>
  <head>
    <title>Eric's World of Waffles</title>
    <link rel="stylesheet" type="text/css" href="sheet1.css" media="all" />
    <style type="text/css">
      @import url(sheet2.css);
      h1 {color: maroon;}
      body {background: yellow;}
      /* These are my styles! Yay! */
    </style>
  </head>
  <body>
    <h1>Waffles!</h1>
    <p style="color: gray;">The most wonderful of all breakfast foods is the
waffle; ridged and cratered slab of home-cooked, fluffy goodness that makes
every child's heart soar with joy. And they're so easy to make! Just a simple
waffle-maker and some batter, and you're ready for a morning of aromatic
ecstasy! </p>
  </body>
</html>
```

# Style Sheet Usage – The Exceptions

6

- Remember we said there are exceptions to style sheet usages?
- Alternate Style Sheets
  - Just like what they sound like. Style sheets that can be selected by the user if the user agent (browser) allows it
  - Declared as: `<style rel="alternate stylesheet" ...>... </style>`
- Example:

```
<link rel="stylesheet" type="text/css" href="sheet1.css"
title="Default" />
<link rel="alternate stylesheet" type="text/css"
href="bigtext.css" title="Big Text" />
<link rel="alternate stylesheet" type="text/css"
href="zany.css" title="Crazy colors!" />
```

# Style Sheet Usage – The Exceptions

7

- Preferred vs. Alternate Style Sheets
  - Style sheets can also be grouped together using the title attribute
  - Give different style sheets the same title and they form a group, but this comes with caveats

```
<link rel="stylesheet" type="text/css" href="sheet1.css"
title="Default" media="screen" /> preferred
<link rel="stylesheet" type="text/css" href="print-sheet1.css"
title="Default" media="print" /> preferred
<link rel="alternate stylesheet" type="text/css" href="bigtext.css"
title="Big Text" media="screen" /> alternate
<link rel="alternate stylesheet" type="text/css" href="print-
bigtext.css" title="Big Text" media="print" /> alternate
```

- rel + stylesheet + title = preferred

# Style Sheet Usage – The Exceptions

8

- Preferred vs. Alternate

- If an alternate style sheet is selected, then none of the preferred style sheets are used
- If multiple style sheets are designated as preferred, i.e. different style sheets with different titles, then only one style sheet is selected and used
  - ✦ Which one is selected? Who knows. There is nothing specified in the HTML/XHTML standard for this

- Persistent Style Sheet

- What you really want
- No title specified, so it always displays in the document

Yeah yeah, enough  
of this style sheet  
mumbo jumbo.  
Let's get back to  
what really matters  
- writing CSS!

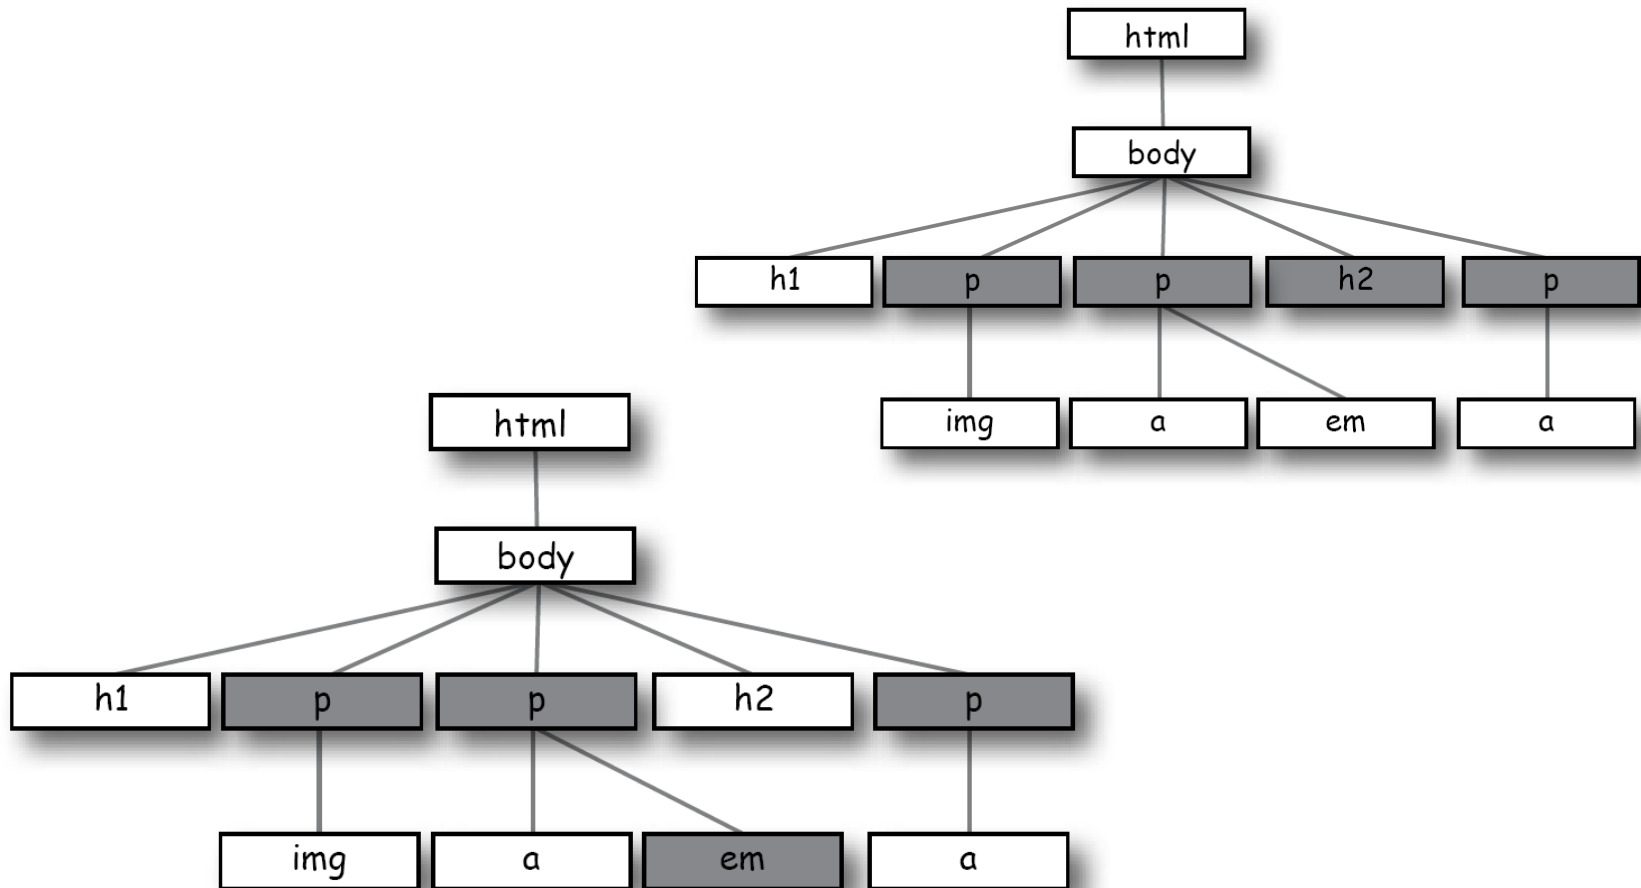

# How Selectors Work

10

# How Selectors Work

11

# Inheritance

12

- It's not money.
- It's similar to the O-O concept
- It describes how styles are passed on to nested elements
- Example
  - Properties declared for the `<p>` element will pass onto its child elements
  - There are exceptions!

# Questions

13

- How do you know which properties are or can be inherited?
  - You don't know off-hand, it's not intuitive
  - Decided by the CSS specification
  - See the full CSS property table at <http://www.w3.org/TR/CSS2/propidx.html>
- How does the browser know which rules to override?

# Overriding Inheritance

14

- To override inheritance, simply create a more specific rule for the element that needs to be changed
- Example

```
body {  
  font-family: Times Roman;  
}  
  
em {  
  font-family: Verdana  
}
```

# Some Quick Info

15

- **Classes**
  - aka Class selector
  - The most common way to apply styles without worrying about the elements involved
  - Example

```
h1.redwarning {  
  color: red;  
}
```

```
<html>
```

```
...
```

```
<h1 class="redwarning">Danger! Danger!</h1>
```

```
...
```

```
</html>
```
